

CONFIGURABLE MEMORY ARRAY

ABSTRACT OF THE DISCLOSURE

There is provided a memory system on a chip. The
5 memory system includes a configurable memory having a first
mode of operation wherein the configurable memory is
configured as a cache and a second mode of operation wherein
the configurable memory is configured as a local, non-cache
memory. A selection of any of the first mode of operation
10 and the second mode of operation is capable of being
overridden by an other selection of an other of the first
mode of operation and the second mode of operation. The
configurable memory may be configured at manufacture time,
at burn-in time, and/or during program execution. Moreover,
15 an access mode of the configurable memory may be determined
from an address corresponding to a memory access
instruction.
